Note: We recommend purchasing grease filled tube over empty tube. It is more convenient to use, saves time and eliminates the risk of rupturing empty tube when filling. It is recommended that when filling empty grease tube that a progressive divider block is used and several lines are filled simultaneously. This will reduce the risk of over pressurising the line, resulting in a rupture. When filling 100m rolls of tube it is recommended that flow grease is used.

Gauges

(Technical Information)

Style and Description

All gauges are Bourdon tube type.

Construction

- All gauges are Bourdon tube type.
- Bourdon tube gauges are suited to most general equipment applications.
- Liquid Filling protects the internals of a gauge from corrosive atmospheres and dampens the effect of vibration and pulsation.
- To prevent damage, gauges should not be used at more than 2/3 of their maximum readout)
- Other types and sizes of gauges are available, please ask our sales staff for further information.

PLEASE NOTE: Liquid filled gauges must be installed in a vertical position so that the rubber bung is at the top. After installation the rubber bung should be pierced with a pin or similar implement to allow the gauge to breath. There may be some leakage during transport caused by heat and elevation variations.

The Pressure Relief Couplings

This innovated Tema technology allows the build-up of pressure in a hydraulic line to be overcome when connecting. This small valve, located in the male and female coupling, will release residual pressure through the micro holes during the connection stage allowing for an easier and smoother connection.
